

Life and Sentience

By RICHARD CLARK

Table of Contents

[Introduction](#)

[Chapter 1 – Our Sun’s Energy](#)

[Chapter 2 – Life](#)

[Chapter 3 – Physical Life](#)

[Chapter 4 – Sentience](#)

[Chapter 5 – Energy](#)

[Chapter 6 – The Purpose of Sentience](#)

[Chapter 7 – Earth Being Prepared for Life](#)

[Chapter 8 – The Sun’s Energies](#)

[Chapter 9 – The Energy of Colours and their Content](#)

[Chapter 10 – Reproduction](#)

[Chapter 11 – The Migration of Present Life](#)

[Chapter 12 – Chemical Interactions](#)

[Chapter 13 – Cells](#)

[Chapter 14 – Advancing Physical Life](#)

[Chapter 15 – Appeasing the Immune System](#)

[Chapter 16 – The Sea of Energy in the Atmosphere](#)

[Chapter 17 – Understanding](#)

[Chapter 18 – The Relationship Between Physical and Brain Sentience and Human Existence](#)

[Chapter 19 – Events and Challenges](#)

[Chapter 20 – Imagination or Visualisation](#)

[Chapter 21 – Afterword](#)

[Chapter 22 – And Finally](#)

INTRODUCTION

Hello and thank you for choosing this book concerning the events that produced physical life on Earth looking at the motivation for it all, or in other words, how and why it happened.

It's not a difficult book to understand and it's not scientific; instead it's an overview of some of the main events in human history from the viewpoint of the driver of those events: Life and Sentience.

Life and Sentience existed independently of physical life before it existed.

Life and Sentience give rise to physical life to help advance and fulfill their own purposes.

Sentience is more active, able to organise matter and motivate energy bringing physical life into existence, and it actively shapes and develops that physical life going forward in order for its own Sentience to increase.

Physical life is developed by Sentience manipulating and supplying energy to cells.

Physical life is ready for mental development once the physical has reached a certain stage of development.

Sentience does this when physical life is ready to advance.

Life is more passive, the essence of existence, joining with matter when it encounters it.

Life has to be infused into matter, turning it into substance containing meaning for physical life to come into existence.

This book isn't written from any point of view or theory, but from a direct perception of the action of Life and Sentience, mostly in humans.

It is a study, however, which will be presented as clearly and simply as possible, hopefully creating a new understanding.

Billions of years ago after the Earth had formed but before any living thing had appeared on it, the Earth at that time was completely sterile, with just the sun's energy streaming down on it having journeyed millions of miles through space.

At some point in time that energy produced physical life on that sterile ball of rock.

Let's take a closer look,

Richard Clark, Bedford, UK

December 2019.

Chapter 1 — OUR SUN'S ENERGY

The sun burns and produces energy by burning hydrogen which leads to physical life on Earth, but it also receives Life and Sentience from another universe, the one just before this one.

The previous universe ran its course with its energies spreading out from its suns until the suns of that universe ran out of fuel and it went dark.

The physical laws of that preceding universe were slightly different from this one and the Life and Sentience there adapted over billions of years to function under those laws.

The physical laws of our universe being slightly different meant that, as Life and Sentience passed through into this universe from the previous one, it was unable to have an effect on dense matter here for billions of years until it adapted by absorbing a lot of the Life and Sentience of this universe.

There are two types of Life and Sentience — the type that came from a previous universe and the type that originated in this universe.

The previous universe to this one is virtually the same as this one with billions of stars and a solar system like ours, except its physical laws were slightly different and that universe has now come to the end of its cycle.

During that cycle much of its energy joined with the Life of that universe which had joined with the Life from the previous universe as every universe has a universe that precedes it.

The Life and Sentience being described here isn't the physical life of that universe, but what's left when the physical life passes away.

Then the Life and Sentience from the solar system in the previous universe, passed from that universe through our sun into this universe.

The passing of Life and Sentience ignited our sun so it started to produce energy which would lead to Life and Sentience here as well when it made contact with dense matter, but this Life and Sentience being part of this universe could affect and use dense matter in this universe right from the start to form physical life on Earth.

It's actually the Life from the previous universe that ignited our sun by passing through it, producing a kind of friction and is the origin of friction in this universe.

Sentience doesn't ignite suns when passing through them as it produces no friction, although the Sentience from our sun in this universe is released from hydrogen as it burns and spreads out through space over vast distances.

The two forms of Life are: Preceding Life from the past universe and Present Life from this one and they will be referred to in that way from now on.

The two forms of Sentience, one from the previous universe and one from this one will be looked at further on.

The Present Life of this universe will be made up of all the energies that our sun produces through burning, once those energies come into contact with dense matter.

Life is more than energy, although it's made up of energies, and neither is it a force or power, so in this book it's just called Life, either Previous Life from the last universe or Present Life from this one.

When the energy produced from our sun's hydrogen burning leaves the sun it isn't yet able to form Present Life as the energy needs to make contact and fuse with dense matter, as opposed to gasses, for Present Life to come into existence transforming 2D lifeless matter into a 3D substance with meaning.

Chapter 2 — LIFE

Previous Life and the Sentience that comes with it from the preceding universes can't operate here in this universe until billions of years have passed.

Previous Life occupies space from the atmosphere around our planet extending outwards into space going as far as the sun's energies have travelled since it ignited and the Earth's atmosphere formed, mirroring it.

Previous Life came into this universe under tremendous pressure from the build-up of Previous Life in the last universe. It was in like the pressure of a garden hose produced by mains water.

This pressure forces Previous Life into this universe through our sun which acts like a bottle neck with the pressure spreading Previous Life over many light years.

The forcing of Previous Life through our sun under such great pressure produced a kind of friction which ignited our sun originally and will keep it burning so long as Previous Life is being forced through it.

Sentience from the last universe also came through in the same way attached to the Previous Life from the last universe and spread with it through this one.

Present Life made up from the energy generated by our sun burning can work and operate in this universe from the time our sun ignited, but it doesn't become Present Life until the sun's energy has made contact and joined with dense matter, mostly on Earth.

So Present Life tends to occupy dense matter in the Earth and planets.

When our sun ignited at the beginning of the cycle, Previous Life and the energy that will give rise to Present Life are separate as they leave the sun, but they will combine over billions of years on Earth, until by the end of the life cycle of the Earth when they will be one.

They will become one by Present Life being processed through physical life which is one of the reasons why the Sentience of this universe working with the Sentience from the previous universe brought physical life into existence.

Previous Life acts as a store containing much of the Present Life and data from the physical life in the last universe it passed through and in many other universes before that.

This data isn't solely the life experiences of physical life, but also the details of its construction and how all the different, individual processes, interactions, energies, systems and everything else work together to produce physical life. It's a data map of existence.

Previous Life stores it as a blueprint or guide which is available to the Sentience of whatever universe Previous Life is travelling through so it can assemble Physical life so the harvesting of Present Life and the energies of that universe can continue.

Physical Life is, in effect, a type of vacuum cleaner sucking up the life and energy of a universe and depositing it into the dust bag which is Previous Life and it's this stored data that's used by the Sentience of this universe as a guide to assemble and develop physical life from the matter and energy of this universe.

The Sentience of this universe accumulates as much of the energy from our sun as is possible by passing it through living things where the energy has become the life and experience of those living things. It accumulates this as data which is streamed into Previous Life during the lifetime of the living thing and on its passing.

The more advanced the living things, the more dense the data stream, and storing the data in Previous Life by passing it through living forms is the only way that Previous Life can absorb the Present Life and energy of this universe.

The passing out of Present Life and energy during the life of physical existence and at the end, gives rise to the aging process and physical death.

Sentience aids this accumulation of Present Life and energy so physical life can be assembled in the universe it's in because Sentience requires physical life to exist to harvest understanding which is how Sentience develops and by joining with it, flows into the Sentience from the previous universe.

As humans develop mentally and become more complex, the human brain develops advanced abilities through understanding, which contribute to humans developing further than other mammals which the Sentience of the previous universe will one day absorb into itself along with the Sentience of this universe.

The flow of understanding and the Sentience of this universe into previous life is not part of the aging process which starts from outside the body whereas the aging process involves the streaming of Present Life and energy out from inside the body.

Physical life was brought into existence by the Sentience of this universe to harvest understanding and gain the advanced mental capacity that can develop from human understanding through which it can join with the Sentience from the previous universe.

Previous Life contains the data for assembling and developing physical life and stores the life experiences and the data map of it that physical life gained during its existence.

Both present and previous Sentience wishes to advance one type of physical life, which in this universe is human life, as far as possible to see what humanity will become and achieve and what, if any, new abilities will be attained that are different from what was attained by advanced life in previous universes.

There's also the possibility of Personal Life coming into existence which will be looked at further on.

The advanced life in previous universes was sometimes human, other times it wasn't.

Present Life, the one from our sun, is infused into the matter of this universe that this universe's Sentience utilises to assemble all the physical life on Earth. Sentience accomplishes this by referring to the data map stored in Previous Life which it acquired while travelling through previous universes.

The data map is massive, almost infinite, containing all the data about everything that has ever existed in every universe it has ever travelled through, but it can never lead to something new as it is old data.

As there's so much data and the time available to the Sentience of this universe is limited to the life of the solar system, about 10 billion years, the vast majority of the data isn't used, the goal being to bring physical life into existence, to diversify and develop it as quickly as possible and to push one species — in this universe, humans — as far as it can go.

Previous Life is also almost infinite as it has absorbed much of the Present Life from all the universes it has passed through and doing this has become its purpose — to continually expand through the absorption of the Present Life of each universe it travels through.

This requires the forming of physical life in each universe and that life has to be made complex and advanced by the constant cycling and recycling of energies from simple forms of physical life, when it passes, into more complex forms.

The Present Life of this universe works on two levels: one is as Life infusing matter, the other as energy.

When all the sun's energies of this universe unify, Present Life comes into existence, but this unifying can only be done in dense matter, not in the sun or in the space that those energies travel through.

The Present Life part of unified energy can't be detected in the way its energies can and Present Life is only apparent and detectable when in physical life.

The energy of Present Life, which is the sun's energy, can be detected as heat, light and with instruments and is used by the Sentience of this universe to assemble physical life.

A by-product of our sun burning hydrogen is a unique, undetectable type of essence which, in humans and some animals, is called Sentience.

As Sentience is formed from the sun burning hydrogen, it joins with the energy of light and this joining enables the Sentience of our sun to travel in the same direction and at the same speed that light does.

It needs to do this to travel as it's unable to connect to Previous Life because that's from different universes and is not compatible early in the sun's life and Present Life doesn't come into existence until the sun's energy comes into contact with dense matter, such as the Earth.

When the sun's energy encounters dense matter such as the Earth bringing Present Life into existence, the journey of the sun's energy is over as when it unites in matter to form Present Life. The energy therefore loses its ability to move.

The ability to move, which works with energy to transport it in a similar way that light transports Physical Sentience, separates from the energy it's connected to and stays in the Earth until Physical Sentience feeds it into cells to form mobile life to give it movement.

The Sentience of this universe links to light which it can connect to in order to travel and disperse throughout space, Earth and surrounding planets and stars.

Previous Life has Sentience travelling with it, gained from its passage through previous universes which stays with Previous Life and moves into what will become humans when we have advanced far enough and it has absorbed enough of the Sentience of this universe to do so thus enabling it to work here.

This started about 200 million years ago.

Once in the physical life that will develop into humans and mammals, it will work to form brains, central nervous systems (CNS) and immune systems and work through them to help advance and develop us mentally.

The Sentience of Present Life assembles and advances physical life in this universe and is capable of open-ended development which the Sentience of the last universe inhabits at the right time.

Chapter 3 — PHYSICAL LIFE

Physical life became possible once enough Present Life had formed in the matter of the Earth, a process which took hundreds of millions of years.

Some physical life such as bacteria, viruses, fungi, moulds and such was formed to help shape humans later in our development.

Neither Present nor Previous Life at this time can be detected by instruments, but Present Life is the product of our sun's energies which can be detected as those energies originate in this universe.

Previous Life is also the product of the energies from billions of previous suns, the same energy as Present Life, but Previous Life and its Sentience needs many billions of years to become part of this universe, and work under its laws, which comes about through the absorption of Present Life and its associated Sentience.

Absorption happens when the Present Life, its energies and the Sentience of this universe pass through organised matter, that is, an advanced living being of some kind, which on the Earth are humans.

Present Life and its energies will stream out from other forms of physical life during their lifetimes, such as different classes of animals, which means they will go through the aging process, but only understanding and the Sentience of this universe can flow through humans which aren't part of the aging process because of its origins from outside the body.

The Sentience that flows out is the Sentience in matter not the Sentience in the brain, so this flow isn't a cause of dementia.

The more complex and advanced humans are, the more understanding and Sentience flows, so humans are constantly under pressure to advance further.

During the life of a human, all its Present Life and energy will flow into Previous Life acting like cloud storage, adapting it to this universe and gradually adding to and changing Previous Life allowing it to work more directly in this universe after billions of years.

The same is true of the Sentience of this universe flowing out of humans into the Sentience of the previous universe.

Humans were advanced and made more complex by the Sentience from the previous universe taking up residence in the brain cells and central nervous systems of humans and working through their immune systems to change, diversify and advance them.
